

/ SHORT CIRCUITING STRAP

Rail Earthing Equipment

/ Use

Short-Circuiting Straps are used to short the positive and negative circuit of a d.c Feeder section. Each Strap consists of three J117-NSE clamps fitted with insulated flexible copper leads. Short circuit straps have been fully tested and approved by Network Rail.

The body of the J117-NSE has an insulating shield to prevent welding to the Rail in the event of a fault current. Clamps are suitable for fitting to both Bull-Head and Flat-Bottomed rails and use a hardened steel tip to penetrate corrosion.

Network Rail approved alternative lengths and tamperproof clamp variants can also be provided if required. Each strap consists of three J117-NSE clamps fitted with flexible insulated copper leads
